                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     176 SCTEAUSV·····SSAYTIAVVVEHELVEMLIVIFCYTFIWILVLÖVEGEVKNDEKEKL 229
                                                                                                                                                                  This sequence represents the human neuropeptide Y (NPY) receptor of the invention, designated NPY-77 receptor. The NPY-Y7 receptor can be used for screening and testing (ant)agonists that are useful for detecting changes in receptor activity and which have potential as anti-hypertensive, cardiovascular, anti-psychotic, anti-obesity and anti-diabetic drugs as well as neuronal growth factors. The DNA sequence can be used to produce NPY-Y7 receptor which in turn can be used to identify (ant)agonists of NPY-Y7 receptor, having commercial value as anti-hypertensive, cardiovascular, anti-psychotic, anti-obesity and anti-diabetic drugs as well as neuronal growth factors.
                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotide encoding a neuropeptide Y (NPY) receptor useful for screening and testing compounds that detect changes in receptor activity and have potential as e.g. anti-hypertensive and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               06-JAN-2000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence encoding a human Halamin trooppool protein may be expressed recombinantly in Fig. CHO Pells. This protein is particularly used to identify agonists or antagonists which has be used to treat e.g. unders, diabetes or dementia, etc. The protein can also be used for the detection of galanin, in the production antibodies, and transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              31-MAY-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transmembrane domain, and an NAXXY motif in transmembrane-7, rather than MPXXY. A CYICHS motif, which is a consensus site for cytochrome-c family heme binding, is present in both 1b and 1a-type receptors. The N-terminus contains 1 consensus N-glycosylation site, Receptor fragments which interact with melatonin, or specific antibodies, may be used as receptor-agonists or receptor—antagonists. Agonists may be used in therapy of circudian rhythm disorders such as jet-lag or day-night cycle disorders, to control cyulation, or in alteration of reproductive Cycles in seasonally breeding animals. Antagonists may be used to control the initiation or timing of puberty in humans. The receptor gene may also be expressed in a transgenic animal for use as a model system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           quanine nucleotide binding proteins (G proteins), with hydrophobic putative transmembrane domains. Unique fea receptors include an NRY motif downstream from the 3rd
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding high affinity melatonin receptor one - used to identify receptor agonists or antagonists e.g. for regulating circadian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 10: Fig 6; 115pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence represents a novel human high-affinity melatonin-lb receptor (mol.wt. 40,188), which is a membrane protein, coupled

                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes peptides (I) binding to galarin receptor proteins. (I) contain the sequence APAHRGRGG or one substantially identical to it, and their precursors, salts, amides and esters, which bind especially to rat galanin receptor proteins. Products from the present invention are used in assays of galanin/galanin receptor binding and the development of drugs acting on galanin binding, such as memory function improvers, appetite improvers, and function regulators for the womb, kidney, prostate, testis or skeletal muscle. Y45129 to Y45154 and 195518 to 25552 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Physiologically active peptide; receptor binding; galanin receptor; GALR1; GALR2; GALR3; chymotrypsin; ligand; preprogalanin; galanin; drug development; memory function; appetite improver; womb; kidney; function regulator; prostate; testis; skeletal muscle.

This sequence is a new form of the melatonin receptor designated MEL-IAb, also known as Mel I-c(beta). The protein differs from previously known receptors by baing 65 jming acids therein and also differs throughout the sequence by 6 amino acids. The protein is encoded by 2 different alleles (79065-6) which differ in the 3 unitranslated region (both sequences encode the same protein), which is shought to affect the half-life of the mRNA. The coding sequence was isolated from cDNA derived from xenopus skin RNA and amplified using the primers 17967-75. The nucleotide sequence encodes a Tiransaconstance receptor involved in cellular signalling. MEL-IAb has been shown to encode the same protein induced by the mental accommutation induced by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ! has 7 hydrophobic putative transmembrane domains. The N-terminus has an N-linked glycosylation site typical for G-protein-coupled receptors, and 2 Cys residues in the 1st 2 extracellular loops may form a stabilizing disulfide bond. Pro residues in transmembrane domains IV. V and VI may introduce kinks in the alpha-helices to form of a ligand binding pocket. Phosphorylation sites in the C-tail may be included in receptor regulation primers from the encoding DNA may be used for isolation of sheep, mouse and human receptor sequences. Receptor fragments which interact with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Comain
                                                                                                                                                                                                                         The sequence represents a high-affinity melatonin receptor (mol.wt. 47,424) from Xenopus laevis. The receptor is a membrane protein, coupled to quantine nucleotide binding proteins (G-proteins), and the coupled to demand the coupled to the couple of the coupled to protein the couple of the coupled to the couple of the coupled to the couple of the coupled to the couple of the co

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               molatonin, or specific antibodies, may be used as receptor-agonists or receptor-antagonists. Agonists may be used in therapy of circadian rhythm disorders such as jet-lag or day-night cycle disorders, to control ovulation, or in alteration of reproductive cycles in scasonally breeding animals. Antagonists may be used to control the initiation or timing of puberty in humans. The receptor gene may also be expressed in a transgenic animal for use
                                                                                                                                                                                                                                                                      Allele: Xenopus laevis; melatonin; receptor; untranslated region; PCR: mRNA; half-life; skin; amplification; primer, polymerase chain reaction; transmembrane domain; cellular signalling; inhibition; adenylyl cyclase, modulation; intracellular; cyclic GMP; inhibitor; phosphodiesterase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

Sequences W25926-7 represent novel allelic Xenopus laevis melatonin receptor MEL-lA proteins. This sequence is a new form of the melatonin receptor designated MEL-lAa, also known as Mel 1-c(alpha). The protein differs from previously known receptors by being 65 amino acids shorter and also having 2 different C-terminal amino acids. The protein is encoded by 2 different alleles (T79083-4) which differ in the 3'
Sequence
                         phosphodiesterase
                                    inhibit adenylyl cyclase, but both proteins can modulate intracellular (MMP), esp. inhibiting its accumulation induced by an inhibitor of
                                                           intranslated region (both sequences encode the same protein), which is thought to affect the half-life of the mRNA. The coding sequence was isolated from cDNA derived from Xenopus skin RNA and amplified using the primers T79057 75. The nucleotide sequence encodes a 7 transmembrane receptor involved in cellular signalling. MEL-LAA has been shown to
                                                                                                                                                                                                                                              New nucleic acid encoding functional melatonin receptor of Xenopus tor screening for potential (ant)agonists useful for e.g. treating cardiovascular disease and cancer

sequence is given in R88412. Receptor fragments which interact with melatonin, or specific antibodies, may be used as receptor-agonists or receptor-antagonists. Agonists may be used in therapy of circadian rhythm disorders such as jet-lag or day-night cycle disorders, to control ovulation, or in alteration of reproductive cycles in seasonally breeding animals. Antagonists may be used to control the initiation or timing of puborty in humans. The receptor gene may also be expressed in a transgenic animal for use as a model system to screen agonists and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           UNA encoding high affinity melatonin receptor one - used to receptor agonists or antagonists e.g. for regulating circadi rhythm disorders or reproductive cycles
Allele; Xenopus laevis; melatonin; receptor, untranslated region; PCR; mRNA; half-life; skin; amplification; primer; polymerase chain reaction; transmembrane domain; cellular signalling, inhibition; adenylyl cyclase; modulation; intracellular; cyclic GMP; inhibitor; phosphodiesterase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          melatonin-la receptor, which is a membrane protein, coupled guanine nucleotide binding proteins (G-proteins), with 7 hydrophobic putative transmembrane domains. The full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence represents a fragment of a human high-affinity melatonin-la receptor, which is a membrane protein, compled gnanine nucleotide binding proteins (G-proteins).                                                                                                                                                                                                                                                                                                                            cycle disorders, to control ovulation, or in alteration of reproductive cycles in seasonally breeding animals. Antagonists may be used to control the initiation or timing of puberty in humans. The receptor gene may also be expressed in a transgenic animal for use as a model system to screen agonists and antagonists
                                                                                                                                                                                                                                                                                                                                                                                                  receptor, which is a membrane protein, employed to granine nucleotide binding proteins (G-proteins), with 7 hydrophobic putative transmembrane Jamains — Receptor fragments which interact with melatonin, or specific annibodies, may be used as receptor-agonists or receptor-antagonists. Agonists may be used in therapy of circulation of disorders such as jet-tag or day-night could disorders such as jet-tag or day-night could disorders such as jet-tag or day-night.

                                            The sequence represents a mouse high-affinity melatonin-la receptor which is a membrane protein, coupled to quantum nucleotide binding proteins (G-proteins). Receptor fragments which interact with melatonin, or specific antibodies, may be used as receptor-agonists or receptor-antagonists. Agonists may be used in therapy of circudian phythm disorders such as jut lay if day night cycle disorders, to control ovulation, or in alteration of reproductive cycles in seasonally breading animals. Antagonists may be used to control the initiation or timing of puberty in humans. The receptor gene may alse be expressed in a transgenic animal for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            melatonin receptor-agonist; melatonin receptor-antagonist; circadian rhythm disorder; jet-lag; day-night cycle disorder; ovulation; reproductive cycle; animal breeding; puberty;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This represents a human melatonin receptor mel-la. The invention provides materials for screening for a substance showing affinity for a melatonin receptor protein, which comparises an admal cell containing an expression plasmid for the gene encoding a human melatonin receptor protein. The cells are useful for screening for human melatonin receptor proteins and its agonist or antagonist e g hormouse and synthetic compounds, by measuring changes in metabolic activity. The recembleant human melatonin receptor protein is useful as it has the same activity as natural human melatonin receptor protein. The new screening metabolic better than prior art radioimmunoassay techniques at quantitatively determining melatonin, which uses antibodies produced by linking

receptor, which is a membrane protein, coupled to guantine
C nucleotide binding proteins (6-proteins), with 7 hydrophobic
C purative transmembrane domains. A practial sequence is given in
C R88411. The N-terminus contains 2 consensus N-glycosylation sites,
C compared to 1 site in the Xenopus receptor (R88409), and the
C-terminal tail is 65 amino acids shorter. Receptor fragments which
C interact with melatonin, or specific antibodies, may be used as
C receptor agonists or receptor aniagonists. Agonists may be used
C in therapy of circadian rhythm disorders such as jet-lag or
C day-night cycle disorders, to control cycledian animals. Antagonists
CC may be used to control the initiation or timing of puberty in
CC numans. The receptor gone may also be expressed in a transgenic
CC animal for use as a model system to screen agonists and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     06-JUN-1995;

• Q

This sequence represents the human melatonin receptor protein. The DNA encoding this sequence is used in an expression vector designated pAKKO-hMeIR7. The expression vector is used to produce the chinese hamster ovary (CHO) cells of the invention. The CHO cells express the human melatonin receptor protein, and can be used to identify compounds (such as agonists and antagonists) having affinity to the receptor. The CHO cells can also be used to produce the receptor. The melatonin receptor agonist can be used as an agent for preventing or treating jet lay. Sleeplessness, seasonal melancholia, Alzheimer's disease, dementia caused by cerebral thrombosis, various diseases accompanying ageing, high blood pressure, cancer, and glaucoma. The melatonin receptor antagonist can be used as an ovulation regulator. The melatonin receptor antagonist can be used as an ovulation regulator.

Patent NO. 5856124

APPLICANT: Reppert, Steven M.
APPLICANT: Ebisawa, Takashi
APPLICANT: EDISawa, Takashi
ITILE OF INVENTION: HIGH-AFFINITY MELATONIN
TITLE OF INVENTION: PRECEPTORS AND USES THEREOF
NUMBER OF SECURICES. 29

COFFERS/NOMENCE ADDRESS:
ADDRESSEE Fish & Richardson P.C.
STREET: 225 Franklin Street
                                                                                                                                                                                                                                                                                                                                                                                                                                             FILING DAIL.
